

Experiment 10

Aim: Creating An Weather App using HTML,CSS and React Js

Theory:

The React Weather App is a dynamic web application designed to deliver real-time weather information for cities worldwide. Built with React, this project showcases the powerful combination of modern web technologies, including API integration, responsive design, and dynamic styling. The application comprises key components such as "App," "SearchEngine," "Forecast," and "Credit," each playing a significant role in providing a seamless user experience.

Output:

Conclusion: In conclusion, the React Weather App project has achieved its objectives by creating a user-friendly, informative, and adaptable web application for accessing weather data. It combines modern web technologies such as React, API integration, responsive design, and dynamic styling to deliver a robust and visually appealing service.
